

RANGOMVARE

Ransom malware holds your data or system hostage until you pay up.

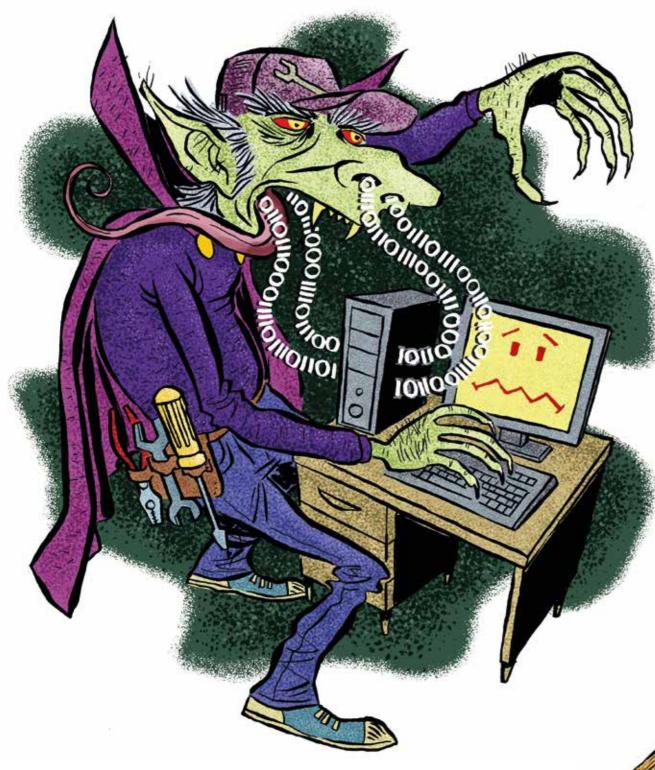

Networks of computers secretly controlled by an attacker, botnets will turn your devices into weapons for DDoS attacks.

MALSPAN

Malicious spam is one of the primary methods of malware infection, it combines sneaky tactics and social engineering to hide malicious links or attachments within the email, tricking users into infecting themselves.

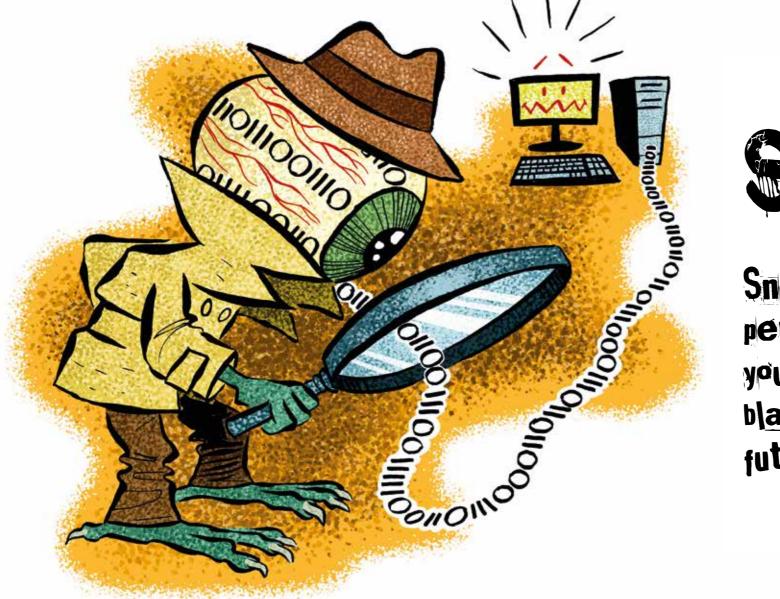

THE CH SUPPORT SCANS

Tech support scams lure you with urgent messages of (fake) infection and demand you pay them to fix the problem.

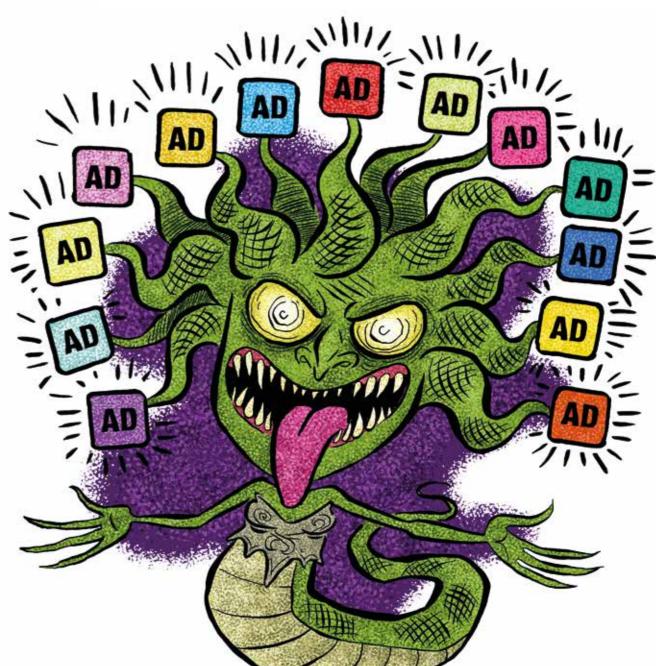

Trojans trick you into thinking they're legit but, once inside your system, unleash malware hell.

Sneaky Spyware collects your personal information without you knowing, selling it on the black market or using it for future attacks.

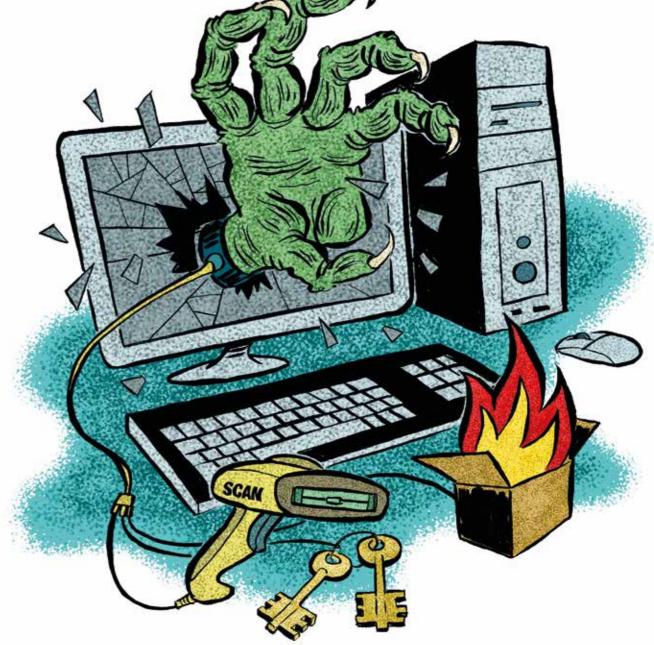

An annoying unwanted guest, adware bombards your device with advertising pop-ups, toolbars, and redirects to websites you didn't intend to visit.

Banker malware focuses on stealing financial data like credit card numbers, bank login credentials, and other data, sometimes directly from forms you fill out in your browser.

Exploit kits look for holes in your system, taking advantage of the weaknesses and delivering malware when they find them.
